

Data Migration.

■ Benefits

Reduce the time and effort needed to move data into Unison CLM.

Unison Data Migration (DM) solution dramatically reduces the time and effort needed to move headers, clauses, line items, and supporting documents into CLM.

Machine Learning

Save time with machine learning powered by Amazon Textract—automatically extract printed text, handwriting, and other data from scanned documents

Bulk Uploads

Minimize the time and effort in bulk data uploads by using a data staging area and specific data connectors

Automation

Automatically import data through a “data vac”—eliminating the need to type in or drag and drop data

■ Key Features

Data Migration simplifies the time consuming, difficult task of moving contract data from multiple repositories, paper storage, and outdated systems into Unison CLM.

- Optical character recognition (OCR) extracts printed text, handwriting, and other data from scanned documents
- Identifies and extracts data from forms and tables
- Combined with EDI VAN mapping services to pull orders and mods from EDA, convert them to XML, and ingest them into Unison CLM
- Data staging area and specific data connectors minimize the time and effort in bulk data uploads
- Recognition of data elements eliminates the need to type in data or drag and drop
- Eliminates keying errors
- Supports data entry that must be 100% correct every time
- Expedites data entry by showing/hiding data entry fields based on data already in the database as well as data users have just entered
